

REPRODUCTIVE HEALTH:

1. What do you think is the significance of reproductive health in a society?

Reproductive health is the total well-being in all aspects of reproduction. It includes physical, emotional, behavioral and social well-being. Sexually transmitted diseases such as AIDS, gonorrhoea, etc. are transferred from one individual to another through sexual contact. It can also lead to unwanted pregnancies. Hence, it is necessary to create awareness among people, especially the youth, regarding various reproduction related aspects as the young individuals are the future of the country and they are most susceptible of acquiring sexually transmitted diseases. Creating awareness about the available birth control methods, sexually transmitted diseases and their preventive measures, and gender equality will help in bringing up a socially conscious healthy family. Spreading awareness regarding uncontrolled population growth and social evils among young individuals will help in building up a reproductively healthy society.

2. Suggest the aspects of reproductive health which need to be given special attention in the present scenario.

Reproductive health is the total well-being in all aspects of reproduction. The aspects which has to be given special attention in the present scenario are:

- a. Counselling and creating awareness among people, especially the youth, about various aspects of reproductive health, such as sexually transmitted diseases, available contraceptive methods, case of pregnant mothers, adolescence etc.
- b. Providing support and facilities such as medical assistance to people during pregnancy, STDs, abortions, contraceptives, infertility etc. for building a reproductively healthy society.

3. What are the suggested reasons for population explosion?

The human population is increasing day by day, leading to population explosion. It is because of the following two major reasons.

- a. Decreased death rate
- b. Increased birth rate and longevity.

The death rate has decreased in the past 50 years. The factor leading to decreased death rate and increased birth rate are control of diseases, awareness and spread of education, improvement in medical facilities, ensured food supply in emergency situation, etc. All this has also resulted in an increase in the longevity of an individual.

4. Is the use of contraceptives justified? Give reasons.

Yes, the use of contraceptives is absolutely justified. The human population is increasing tremendously. Therefore, to regulate the population growth by regulating reproduction has become a necessary demand in the present times. Various contraceptive devices have been devised to reduce unwanted pregnancies, which help in bringing down the increased birth rate and hence, in checking population explosion.

5. Removal of gonads cannot be considered as a contraceptive option. Why?

Contraceptive devices are used to prevent unwanted pregnancy and to prevent the spreading of STD's. There are many methods such as natural, barrier, oral and surgical methods that prevent unwanted pregnancy. However, the complete removal of gonads

cannot be a contraceptive option because it will lead to infertility and unavailability of certain hormones that are required for normal functioning of accessory reproductive parts. Therefore, only those contraceptive methods can be used that prevent the chances of fertilization rather than making the person infertile forever.

6. Amniocentesis for sex determination is banned in our country. Is this ban necessary?

Comment.

Amniocentesis is a pre-natal diagnostic technique that is used to determine the sex and metabolic disorders of the developing foetus in the mother's uterus through the observation of the chromosomal patterns. This method was developed to determine any kind of genetic disorder present in the foetus. However, unfortunately this technique is being misused to detect the sex of the child before birth and the female foetus is then aborted. Thus, to prevent the increasing female foeticides, it is necessary to ban the usage of amniocentesis technique for determining the sex of a child.

7. Suggest some methods to assist infertile couples to have children.

Infertility is the inability of a couple to produce a baby even after unprotected intercourse. It might be due to abnormalities present in either male or female or might be even both the partners. The techniques used to assist infertile couples to have children are as follows:

- a. *Test tube babies*: This involves in-vitro fertilization where the sperms meet the egg outside the body of a female. The zygote, hence produced, is then transferred in the uterus or fallopian tube of a normal female. The babies produced from this method are known as test tube babies.
- b. *Gamete Intra fallopian transfer (GIFT)*: It is a technique that involves the transfer of gamete (ovum) from a donor into the fallopian tube of the recipient female who is unable to produce eggs, but has the ability to conceive and can provide right conditions for the development of an embryo.
- c. *Intra Cytoplasmic sperm injection (ICSI)*: It is a method of injecting sperm directly into the ovum to form an embryo in laboratory.
- d. *Artificial insemination*: It is a method of transferring semen (sperm) from a healthy male donor into the vagina or uterus of the recipient female. It is employed when the male partner is not able to inseminate the female or has low sperm counts.

8. What are the measures one must take to prevent from contradicting STD's?

Sexually transmitted diseases (STD's) get transferred from one individual to the other through sexual contact. Adolescents and young adults are at the greater risk of acquiring these sexually transmitted diseases. Hence, creating awareness among the adolescents regarding its after-effects can prevent them from contracting STD's. The use of contraceptives, such as condoms, etc. while intercourse, can prevent the transfer of these diseases. Also, sex with unknown partners or multiple partners should be avoided as they may have such diseases. Specialists should be consulted immediately in case of doubt to assure early detection and cure of the disease.

9. Do you think that reproductive health in our country has improved in the past 50 years? If yes, mention some such areas of improvement.

Yes, the reproductive health has tremendously improved in India in the last 50 years. The areas of improvement are as follows.

- a. Massive child immunization programme, which has led to a decrease in the infant mortality rate.
- b. Maternal and infant mortality rate, which has been decreased drastically due to better post-natal care.
- c. Family planning, which has motivated people to have smaller families.
- d. Use of contraceptive, which has resulted in a decrease in the rate of sexually transmitted diseases and unwanted pregnancies.

10. Is sex education necessary in schools? Why?

Yes, introduction of sex education in schools is necessary. It would provide right information to young individuals at the right time about various aspects of reproductive health such as reproductive organs, puberty, and adolescence related changes, safe sexual practices, sexually transmitted diseases, etc. The young individual or adolescents are more susceptible in acquiring various sexually transmitted diseases. Hence, providing information to them at the right time would help them to lead a reproductively healthy life and protect them from the myths and misconceptions about various sex related issues.
